(54) Title: ACID AND ESTER COMPOUNDS AND METHODS OF USING THE SAME

(57) Abstract: Disclosed is a compound of having the formula (II-A), pharmaceutically acceptable salts or solvates thereof and pharmaceutical compositions containing the same, wherein the structural variables are as defined herein. The compounds, salts and solvates of this invention are useful as LXR agonists.

## FIELD OF THE INVENTION

The present invention relates to compounds useful as modulating agents for liver X receptors (LXR). Additionally, the present invention relates to pharmaceutical formulations comprising such compounds, and the therapeutic use of the same.

## BACKGROUND OF THE INVENTION

LXR is a transcription factor. The orphan nuclear receptors, LXR $\alpha$  and LXR $\beta$  (collectively LXR) play a role in the maintenance of cholesterol balance. Peet *et al.*, *Curr. Opin. Genet. Dev.* 8:571-575 (1998). In addition, LXR binds to the ATP Binding Cassette Transporter-1 (ABCA1) gene and increases expression of the gene to result in increased ABCA1 protein. ABCA1 is a membrane bound transport protein which is involved in the regulation of cholesterol efflux from extrahepatic cells onto nascent HDL particles. Mutations in the ABCA1 gene are responsible for genetic diseases that result in the complete absence or low levels of HDL cholesterol and a concomitant highly increased risk of cardiovascular disease. See Brooks-Wilson *et al.*, *Nat. Genet.* 22:336-345 (1999); Bodzioch *et al.*, *Nat. Genet.* 22: 347-351 (1999); and Rust *et al.*, *Nat. Genet.* 22:352-355 (1999). ABCA1 knockout mice homozygous for the mutation in the ABCA1 gene have virtually no plasma HDL, whereas the heterozygotes produce 50% of the HDL of wild type animals. See, Orso *et al.*, *Nat. Genet.* 24:192-196 (2000) and McNeish *et al.*, *Proc. Natl. Acad. Sci. USA* 97:4245-4250 (2000). ABCA1 knockout mice also show increased cholesterol absorption. See, McNeish *et al.*, *Proc. Natl. Acad. Sci. USA* 97:4245-4250 (2000). Increased expression of ABCA1 results in increased HDL cholesterol, decreased absorption of cholesterol, and increased removal of excess cholesterol from extrahepatic tissues, including macrophages. LXR agonists also upregulate macrophage expression of apolipoprotein E and ABCG1, both of which contribute to the efflux of cellular cholesterol. By stimulating macrophage cholesterol efflux through upregulation of ABCA1, ABCG1, and apoE expression, as well as increasing the expression of other target genes including cholesteryl ester transfer protein and lipoprotein lipase, LXR agonists influence plasma lipoproteins.

Accordingly, compounds which function as LXR modulating agents, and particularly as LXR agonists, would be useful in methods of increasing ABCA1,

ABCG1, and apolipoprotein E expression, increasing cholesterol efflux from peripheral cells, and treating LXR mediated diseases and conditions such as cardiovascular disease and inflammation.

## DETAILED DESCRIPTION OF THE INVENTION

As used herein, the term "alkyl" represents a straight-or branched-chain saturated hydrocarbon, containing 1 to 10 carbon atoms, unless otherwise provided, which may be unsubstituted or substituted by one or more of the substituents described below. Exemplary alkyls include, but are not limited to methyl (Me), ethyl (Et), n-propyl, isopropyl, n-butyl, isobutyl, t-butyl, n-pentyl, neopentyl and hexyl and structural isomers thereof. Any "alkyl" herein may be optionally substituted by one or more of the substituents independently selected from the group halo, -OH, -SH, -NH<sub>2</sub>, -NH(unsubstituted C<sub>1</sub>-C<sub>6</sub> alkyl), -N(unsubstituted C<sub>1</sub>-C<sub>6</sub> alkyl)(unsubstituted C<sub>1</sub>-C<sub>6</sub> alkyl), unsubstituted -OC<sub>1</sub>-C<sub>6</sub> alkyl, and -CO<sub>2</sub>H.

When combined with another substituent term (e.g., aryl or cycloalkyl as in -alkyl-Ar or -alkyl-cycloalkyl), the "alkyl" term therein refers to an alkylene moiety, that is, an unsubstituted divalent straight-or branched-chain saturated hydrocarbon moiety, containing 1 to 10 carbon atoms, unless otherwise provided. For example, the term "-C<sub>0</sub>-C<sub>6</sub> alkyl-Ar", where C is 1-6 is intended to mean the radical -alkyl-aryl (e.g., -CH<sub>2</sub>-aryl or -CH(CH<sub>3</sub>)-aryl) and is represented by the bonding arrangement present in a benzyl group. The term "C<sub>0</sub> alkyl" in a moiety, such as -C<sub>0</sub>-C<sub>6</sub> alkyl-Ar or -O-(C<sub>0</sub>-C<sub>6</sub> alkyl)-Ar, provides for no alkyl/alkylene group being present in the moiety. Thus, when C is zero, -C<sub>0</sub>-C<sub>6</sub> alkyl-Ar is equivalent to -Ar and -O-(C<sub>0</sub>-C<sub>6</sub> alkyl)-Ar is equivalent to -O-Ar.

As used herein, the term "alkenyl" represents a straight-or branched-chain hydrocarbon, containing 2 to 10 carbon atoms, unless otherwise provided, and one or more carbon-carbon double bonds. Alkenyl groups may be unsubstituted or substituted by one or more of the substituents described below. Exemplary alkenyls include, but are not limited ethenyl, 1-propenyl, 2-propenyl, 1-butenyl, 2-butenyl, isobutenyl, butadienyl, pentenyl and hexenyl and structural isomers thereof. Both cis (Z) and trans (E) isomers of each double bond that may be present in the compounds of this invention are included within the scope of this invention. Any "alkenyl" herein may be optionally substituted by one or more of the substituents independently selected from the group halo, -OH, -SH, -NH<sub>2</sub>, -NH(unsubstituted C<sub>1</sub>-C<sub>6</sub> alkyl), -N(unsubstituted C<sub>1</sub>-C<sub>6</sub> alkyl)(unsubstituted C<sub>1</sub>-C<sub>6</sub> alkyl), unsubstituted -OC<sub>1</sub>-C<sub>6</sub> alkyl, and -CO<sub>2</sub>H.

As used herein, the term "alkynyl" represents a straight-or branched-chain hydrocarbon, containing 2 to 10 carbon atoms, unless otherwise provided, and one

or more carbon-carbon triple bonds and, optionally, one or more carbon-carbon double bonds. Both cis (Z) and trans (E) isomers of each double bond that may be present in the compounds of this invention are included within the scope of this invention. Exemplary alkynyls include, but are not limited ethynyl, propynyl

5 (propargyl, isopropynyl), 1-butylnyl, 2-butylnyl, 3-butylnyl, pentynyl and hexynyl and structural isomers thereof. Any "alkynyl" herein may be optionally substituted by one or more of the substituents independently selected from the group halo, -OH, -SH, -NH<sub>2</sub>, -NH(unsubstituted C<sub>1</sub>-C<sub>6</sub> alkyl), -N(unsubstituted C<sub>1</sub>-C<sub>6</sub> alkyl)(unsubstituted C<sub>1</sub>-C<sub>6</sub> alkyl), unsubstituted -OC<sub>1</sub>-C<sub>6</sub> alkyl, and -CO<sub>2</sub>H.

10 For the purposes of this invention, when an alkenyl or alkynyl group is a substituent on an oxygen, nitrogen or sulfur atom (e.g., as in oxy (-OR), thio (-SR), ester (-CO<sub>2</sub>R or -C(O)SR), amino (-NRR) or amido (-CONRR) moieties and the like), it is understood that a double or triple bond of the alkenyl or alkynyl group is not located on carbons that are  $\alpha,\beta$  to the oxygen, nitrogen or sulfur atom.

15 Compounds containing ene-amino or enol-type moieties (-NR-CR=CR- or -O-CR=CR-) are not intended to be included within the scope of this invention.

If a substituent described herein is not compatible with the synthetic methods of this invention, the substituent may be protected with a suitable protecting group that is stable to the reaction conditions used in these methods. The protecting group may be removed at a suitable point in the reaction sequence of the method to provide a desired intermediate or target compound. Suitable protecting groups and the methods for protecting and de-protecting different substituents using such suitable protecting groups are well known to those skilled in

the art; examples of which may be found in T. Greene and P. Wuts, *Protecting Groups in Chemical Synthesis* (3rd ed.), John Wiley & Sons, NY (1999), which is incorporated herein by reference in its entirety. In some instances, a substituent may be specifically selected to be reactive under the reaction conditions used in the methods of this invention. Under these circumstances, the reaction conditions convert the selected substituent into another substituent that is either useful as an intermediate compound in the methods of this invention or is a desired substituent in a target compound.

The term "pharmaceutically acceptable salt" is intended to describe a salt that retains the biological effectiveness of the free acid or base of a specified compound and is not biologically or otherwise undesirable.

If an inventive compound is a base, a desired salt may be prepared by any suitable method known in the art, including treatment of the free base with an inorganic acid, such as hydrochloric acid, hydrobromic acid, sulfuric acid, sulfamic acid, nitric acid, phosphoric acid, metaphosphoric acid and the like, or with an organic acid, such as acetic acid, trifluoroacetic acid, formic acid, maleic acid, lactic acid, succinic acid, mandelic acid, fumaric acid, malonic acid, malic acid, pyruvic acid, oxalic acid, glycolic acid, citric acid, tartaric acid, gluconic acid, glutaric acid, lactobionic, orotic, cholic, a pyranosidyl acid, such as glucuronic acid or galacturonic acid, an amino acid, such as aspartic acid or glutamic acid, an aromatic acid, such as benzoic acid, salicylic acid, cinnamic acid, pamoic acid or 1-hydroxy-2-naphthoic acid, a sulfonic acid, such as benzenesulfonic acid, p-toluenesulfonic acid, naphthalenesulfonic acid, methanesulfonic acid, ethanesulfonic acid or the like. Additional examples of pharmaceutically acceptable salts include sulfates, pyrosulfates, bisulfates, sulfites, bisulfites, phosphates, chlorides, bromides, iodides, acetates, propionates, decanoates, caprylates, acrylates, formates, isobutyrate, caproates, heptanoates, propiolates, oxalates, malonates succinates, suberates, sebacates, fumarates, maleates, butyne-1,4-dioates, hexyne-1,6-dioates, benzoates, chlorobenzoates, methylbenzoates, dinitrobenzoates, hydroxybenzoates, methoxybenzoates, phthalates, phenylacetates, phenylpropionates, phenylbutyrates, citrates, lactates,  $\gamma$ -hydroxybutyrates, glycollates, tartrates mandelates, and sulfonates, such as xylenesulfonates, methanesulfonates, propanesulfonates, naphthalene-1-sulfonates and naphthalene-2-sulfonates. Embodiments of a pharmaceutically acceptable salt (e.g., the hydrochloride salt) of the compounds of this invention are provided in the Examples.

If an inventive compound is an acid, a desired salt may be prepared by any suitable method known to the art, including treatment of the free acid with an excess of an inorganic or organic alkaline reagent. Illustrative examples of suitable salts include salts derived from ammonia; primary, secondary, tertiary amines (including secondary and tertiary cyclic amines), such as ethylene diamine, dicyclohexylamine, ethanolamine, piperidine, morpholine, and piperazine; salts derived from amino acids such as glycine and arginine; as well as salts derived from an alkali metal, alkaline earth metal, or ammonium hydroxide, carbonate, alkoxide or sulfate, such as sodium hydroxide, sodium carbonate, sodium bicarbonate, sodium sulfate, etc., and corresponding alkaline salts containing, for example,  $\text{Li}^+$ ,  $\text{K}^+$ ,  $\text{Ca}^{++}$ ,  $\text{Mg}^{++}$  and  $\text{NH}_4^+$  cations.

The term "solvate" is intended to mean a pharmaceutically acceptable solvate form of a specified compound of this invention, or a salt thereof, that retains the biological effectiveness of such compound. Examples of solvates include compounds of the invention in combination with water, isopropanol, ethanol, methanol, DMSO, ethyl acetate, acetic acid, or ethanolamine. In the case of compounds, salts, or solvates that are solids, it is understood by those skilled in the art that the inventive compounds, salts, or solvates may exist in different crystal forms, all of which are intended to be within the scope of the present invention and specified formulas.

Because the compounds of this invention may contain both acid and base moieties, pharmaceutically acceptable salts may be prepared by treating these compounds with an alkaline reagent or an acid reagent, respectively. Accordingly, this invention also provides for the conversion of one pharmaceutically acceptable salt of a compound of this invention, e.g., a hydrochloride salt, into another pharmaceutically acceptable salt of a compound of this invention, e.g., a mesylate salt or a sodium salt.

Also included within the scope of this invention are prodrugs of the compounds of this invention. The ester compounds of this invention, wherein X is other than -OH, may be considered prodrugs. Such ester compounds may be converted to compounds that are active as LXR modulators and may be, themselves, active as LXR modulators. The term "prodrug" is intended to mean a compound that is converted under physiological conditions, e.g., by solvolysis or metabolically, to a compound according to this invention that is pharmaceutically active. A prodrug may be a derivative of one of the compounds of this invention that contains a carboxylic or phosphoric acid ester or amide moiety that may be

cleaved under physiological conditions. A prodrug containing such a moiety may be prepared according to conventional procedures, for example, by treatment of a compound of this invention containing an amino, amido or hydroxyl moiety with a suitable derivatizing agent, for example, a carboxylic or phosphoric acid halide or acid anhydride, or by converting a carboxyl moiety of a compound of this invention to an ester or amide. Prodrugs of the compounds of this invention may be determined using techniques known in the art, for example, through metabolic studies. See, e.g., "Design of Prodrugs," (H. Bundgaard, Ed.) 1985, Elsevier Publishers B.V., Amsterdam, The Netherlands.

The compounds of this invention may contain at least one chiral center and may exist as single stereoisomers (e.g., single enantiomers), mixtures of stereoisomers (e.g., any mixture of enantiomers or diastereomers) or racemic mixtures thereof. All such single stereoisomers, mixtures and racemates are intended to be encompassed within the broad scope of the present invention.

Compounds identified herein as single stereoisomers are meant to describe compounds that are present in a form that are at least 90% enantiomerically pure. Where the stereochemistry of the chiral carbons present in the chemical structures illustrated herein is not specified, the chemical structure is intended to encompass compounds containing either stereoisomer of each chiral center present in the compound. Such compounds may be obtained synthetically, according to the procedures described herein using optically pure (enantiomerically pure) or substantially optically pure materials. Alternatively, these compounds may be obtained by resolution/separation of a mixture of stereoisomers, including racemic mixtures, using conventional procedures. Exemplary methods that may be useful for the resolution/separation of mixtures of stereoisomers include chromatography and crystallization/re-crystallization. Other useful methods may be found in "Enantiomers, Racemates, and Resolutions," J. Jacques et al., 1981, John Wiley and Sons, New York, NY, the disclosure of which is incorporated herein by reference.

The group describes a 6-membered aromatic ring, specifically, a phenyl or pyridyl ring, which may be unsubstituted ( $k = 0$ ) or substituted by one or more substituents  $R^3$ . In a preferred embodiment, the compounds of this invention are defined where Z is CH. The total number of  $R^3$  substituents that may be present in a compound of this invention is represented by "k". When Z is  $CR^3$ , k is 0-4, meaning that there can be up to four  $R^3$  substituents on the 6-membered aromatic ring. When Z is CH or N, k is 0-3, meaning that there can be up to three  $R^3$  substituents on the 6-membered aromatic ring. Preferably, k is 0 or 1.

In the embodiments wherein k is 1 or more, each  $R^3$  may be the same or different. In specific embodiments of this invention, each  $R^3$  is independently selected from halo,  $C_1$ - $C_4$  alkyl and  $C_1$ - $C_4$  alkoxy. The term "LXR modulator," as used herein, means a small molecule that modulates the biological activities of LXR $\alpha$  and/or LXR $\beta$ . More specifically, such an LXR modulator either enhances or inhibits the biological activities of LXR. If such a modulator partially or completely enhances the biological activities of LXR, it is a partial or complete LXR agonist, respectively. If such a modulator partially or completely inhibits the biological activities of LXR, it is a partial or complete LXR antagonist, respectively. Preferably, the LXR modulator compounds of this invention are LXR agonists. As used herein, the term "LXR agonist" refers to compounds which achieve at least 20% activation of LXR relative to 24(S),25-epoxycholesterol, the appropriate positive control in the HTRF assay described below in Test Method 1. It should be noted that to show activity in the specific Test Methods described herein, the LXR modulator compound must bind to the LXR nuclear receptor and recruit the specific peptide derived from the coactivator protein, SRC1, to the modulator compound-bound LXR complex. The compounds of this invention that

form an LXR-modulator compound-complex and recruit SRC1, may also recruit at least one or more of the other >80 known different nuclear receptor cofactors. Recruiter peptides derived from any of these other nuclear receptor cofactors may be similarly prepared and assayed according to known procedures.

- 5           Compounds that are closely structurally related to the compounds of Examples 1-53 have been prepared that do not demonstrate at least 20% recruitment of the SRC1-derived peptide. It is anticipated, however, that such compounds do bind to LXR. It is further anticipated that such an LXR-modulator compound-complex will recruit at least one or more of the other >80 known
- 10 different nuclear receptor cofactors. Examples of such compounds include: (3-[(*R*)-3-(2,2-diphenylethylamino)-1-methyl-propoxy]-phenyl)-acetic acid having a Q-(CR<sup>8</sup>R<sup>9</sup>)<sub>q</sub>- group consisting of Q-(CH<sub>2</sub>)- wherein Q is 2-chlorophenyl, 2-chloro-pyridin-3-yl, 6-methyl-pyridin-2-yl, 2-fluoro-5-trifluoromethylphenyl, 2-chloro-5-trifluoromethylphenyl, and 2-chloro-3,4-dimethoxyphenyl; {3-[(*R*)-3-[(2,2-
- 15 diphenylethylamino)-2-methyl-propoxy]-phenyl}acetic acid having a Q-(CR<sup>8</sup>R<sup>9</sup>)<sub>q</sub>- group consisting of Q-(CH<sub>2</sub>)- wherein Q is 2-fluoro-5-trifluoromethylphenyl, 2-chloro-3,4-dimethoxyphenyl, 2-chloro-4-trifluoromethylphenyl, 3-bromo-4-methoxyphenyl, 2-fluoro-5-methoxyphenyl, 2,6-difluorophenyl, 3,5-dimethylphenyl, 2-bromophenyl, 3-iodophenyl, 4-(methylthio)phenyl, 3-furyl, 2-chloro-pyridin-3-yl, 2-

The compounds of this invention are useful for a variety of medicinal purposes. The compounds of this invention may be used in methods for the prevention or treatment of LXR mediated diseases and conditions. This invention

30 further provides compounds of this invention for use in the preparation of a medicament for the prevention or treatment of an LXR mediated disease or condition. LXR mediated diseases or conditions include inflammation, cardiovascular disease including atherosclerosis, arteriosclerosis, hypercholesteremia, and hyperlipidemia. In particular, the compounds of this

35 invention are useful in the treatment and prevention of inflammation, cardiovascular disease including atherosclerosis and hypercholesteremia.

The present invention also provides a method for increasing reverse cholesterol transport, compounds of this invention for increasing reverse cholesterol transport and the use of compounds of this invention for the preparation of a medicament for increasing reverse cholesterol transport. Lipoprotein metabolism is a dynamic process comprised of production of triglyceride rich particles from the liver (as VLDL), modification of these lipoprotein particles within the plasma (VLDL to IDL to LDL) and clearance of the particles from the plasma, again by the liver. This process provides the transport of triglycerides and free cholesterol to cells of the body. Reverse cholesterol transport is the proposed mechanism by which peripheral cholesterol is returned to the liver from extra-hepatic tissue. The process is carried out by HDL cholesterol. The combination of lipoprotein production (VLDL, HDL) from the liver, modification of particles (all) within the plasma and subsequent clearance back to the liver, accounts for the steady state cholesterol concentration of the plasma. Without wishing to be bound by any particular theory, it is currently believed that the compounds of this invention increase reverse cholesterol transport by increasing cholesterol efflux from the arteries.

Additionally, this invention provides a method for inhibiting cholesterol absorption, compounds of this invention for inhibiting cholesterol absorption and the use of compounds of this invention for the preparation of a medicament for inhibiting cholesterol absorption. This invention also provides a method for increasing reverse cholesterol transport, compounds of this invention for increasing reverse cholesterol transport and the use of compounds of this invention for the preparation of a medicament for increasing reverse cholesterol transport.

The compounds of this invention may also be useful for the prevention or treatment of inflammation and neurodegenerative diseases or neurological disorders. Accordingly, this invention also provides a method for preventing or treating inflammation (See A.J. Fowler et al., J. Invest. Dermatol., 2003 Feb., 120 (2): 246-255 and S.B. Joseph, et al. Nat. Med., 2003 Feb., 9 (2): 213-219) and a method for preventing or treating neurodegenerative diseases or neurological disorders, particularly neurodegenerative diseases or disorders characterized by neuron degeneration, neuron injury or impaired plasticity or inflammation in the CNS (as disclosed in U.S. Provisional Patent Application No. 60/368,424, filed 27 March, 2002). Particular diseases or conditions that are characterized by neuron degeneration and inflammation, and thus benefiting from the growth and/or repair of neurons include stroke, Alzheimer's disease, fronto-temporal dementias (tauopathies), peripheral neuropathy, Parkinson's disease, dementia with Lewy

bodies, Huntington's disease, amyotrophic lateral sclerosis and multiple sclerosis. Diseases or conditions that are characterized by neuron degeneration and/or impaired plasticity include psychiatric disorders such as schizophrenia and depression. Particular diseases or conditions that are characterized by neuronal  
5 injury include those conditions associated with brain and/or spinal cord injury, including trauma.

The methods of the present invention are useful for the treatment of animals including mammals generally and particularly humans. The present invention further provides the use of compounds of this invention for the preparation of a  
10 medicament for increasing reverse cholesterol transport.

The methods of the present invention comprise the step of administering a therapeutically effective amount of a compound of this invention. As used herein, the term "therapeutically effective amount" refers to an amount of a compound of this invention which is sufficient to achieve the stated effect. Accordingly, a  
15 therapeutically effective amount of a compound of this invention used in the method for the prevention or treatment of LXR mediated diseases or conditions will be an amount sufficient to prevent or treat the LXR mediated disease or condition. Similarly, a therapeutically effective amount of a compound of this invention for use in the method of increasing reverse cholesterol transport will be an amount  
20 sufficient to increase reverse cholesterol transport.

The amount of a compound of this invention or pharmaceutically acceptable salt or solvate thereof, which is required to achieve the desired biological effect will depend on a number of factors such as the use for which it is intended, the means of administration, and the recipient, and will be ultimately at the discretion of the  
25 attendant physician or veterinarian. In general, a typical daily dose for the treatment of LXR mediated diseases and conditions in a human, for instance, may be expected to lie in the range of from about 0.01 mg/kg to about 100 mg/kg. This dose may be administered as a single unit dose or as several separate unit doses or as a continuous infusion. Similar dosages would be applicable for the treatment  
30 of other diseases, conditions and therapies including increasing reverse cholesterol transport, and inhibiting cholesterol absorption.

In another embodiment, the present invention provides pharmaceutical compositions comprising a compound of this invention or a pharmaceutically acceptable salt or solvate thereof, as the active ingredient, and at least one  
35 pharmaceutical carrier or diluent. These pharmaceutical compositions may be used in the prophylaxis and treatment of the foregoing diseases or conditions and in

cardiovascular therapies as mentioned above. The carrier must be pharmaceutically acceptable and must be compatible with, i.e. not have a deleterious effect upon, the other ingredients in the composition. The carrier may be a solid or liquid and is preferably formulated as a unit dose formulation, for example, a tablet which may contain from 0.05 to 95% by weight of the active ingredient.

Possible formulations include those suitable for oral, sublingual, buccal, parenteral (for example subcutaneous, intramuscular, or intravenous), rectal, topical including transdermal, intranasal and inhalation administration. Most suitable means of administration for a particular patient will depend on the nature and severity of the disease or condition being treated or the nature of the therapy being used and on the nature of the active compound, but where possible, oral administration is preferred for the prevention and treatment of LXR mediated diseases and conditions.

Formulations suitable for oral administration may be provided as discrete units, such as tablets, capsules, cachets, lozenges, each containing a predetermined amount of the active compound; as powders or granules; as solutions or suspensions in aqueous or non-aqueous liquids; or as oil-in-water or water-in-oil emulsions.

Formulations suitable for sublingual or buccal administration include lozenges comprising the active compound and, typically a flavored base, such as sugar and acacia or tragacanth and pastilles comprising the active compound in an inert base, such as gelatin and glycerine or sucrose acacia.

Formulations suitable for parenteral administration typically comprise sterile aqueous solutions containing a predetermined concentration of the active compound; the solution is preferably isotonic with the blood of the intended recipient. Additional formulations suitable for parenteral administration include formulations containing physiologically suitable co-solvents and/or complexing agents such as surfactants and cyclodextrins. Oil-in-water emulsions are also suitable formulations for parenteral formulations. Although such solutions are preferably administered intravenously, they may also be administered by subcutaneous or intramuscular injection.

Formulations suitable for rectal administration are preferably provided as unit-dose suppositories comprising the active ingredient in one or more solid carriers forming the suppository base, for example, cocoa butter.

Formulations suitable for topical or intranasal application include ointments, creams, lotions, pastes, gels, sprays, aerosols and oils. Suitable carriers for such formulations include petroleum jelly, lanolin, polyethyleneglycols, alcohols, and combinations thereof.

5           Formulations of the invention may be prepared by any suitable method, typically by uniformly and intimately admixing the active compound with liquids or finely divided solid carriers or both, in the required proportions and then, if necessary, shaping the resulting mixture into the desired shape.

For example a tablet may be prepared by compressing an intimate mixture  
10           comprising a powder or granules of the active ingredient and one or more optional ingredients, such as a binder, lubricant, inert diluent, or surface active dispersing agent, or by molding an intimate mixture of powdered active ingredient and inert liquid diluent.

Suitable formulations for administration by inhalation include fine particle  
15           dusts or mists which may be generated by means of various types of metered dose pressurized aerosols, nebulisers, or insufflators.

For pulmonary administration via the mouth, the particle size of the powder or droplets is typically in the range 0.5 -10 $\mu$ M, preferably 1-5 $\mu$ M, to ensure delivery into the bronchial tree. For nasal administration, a particle size in the range 10-  
20           500 $\mu$ M is preferred to ensure retention in the nasal cavity.

Metered dose inhalers are pressurized aerosol dispensers, typically containing a suspension or solution formulation of the active ingredient in a liquefied propellant. During use, these devices discharge the formulation through a valve adapted to deliver a metered volume, typically from 10 to 150  $\mu$ L, to produce a fine  
25           particle spray containing the active ingredient. Suitable propellants include certain chlorofluorocarbon compounds, for example, dichlorodifluoromethane, trichlorofluoromethane, dichlorotetrafluoroethane and mixtures thereof. The formulation may additionally contain one or more co-solvents, for example, ethanol surfactants, such as oleic acid or sorbitan trioleate, anti-oxidants and suitable  
30           flavoring agents. Nebulisers are commercially available devices that transform solutions or suspensions of the active ingredient into a therapeutic aerosol mist either by means of acceleration of a compressed gas typically air or oxygen, through a narrow venturi orifice, or by means of ultrasonic agitation. Suitable formulations for use in nebulisers consist of the active ingredient in a liquid carrier  
35           and comprising up to 40% w/w of the formulation, preferably less than 20%w/w. The carrier is typically water or a dilute aqueous alcoholic solution, preferably made

isotonic with body fluids by the addition of, for example, sodium chloride. Optional additives include preservatives if the formulation is not prepared sterile, for example, methyl hydroxy-benzoate, anti-oxidants, flavoring agents, volatile oils, buffering agents and surfactants.

5            Suitable formulations for administration by insufflation include finely comminuted powders which may be delivered by means of an insufflator or taken into the nasal cavity in the manner of a snuff. In the insufflator, the powder is contained in capsules or cartridges, typically made of gelatin or plastic, which are either pierced or opened *in situ* and the powder delivered by air drawn through the  
10           device upon inhalation or by means of a manually-operated pump. The powder employed in the insufflator consists either solely of the active ingredient or of a powder blend comprising the active ingredient, a suitable powder diluent, such as lactose, and an optional surfactant. The active ingredient typically comprises from 0.1 to 100 w/w of the formulation.

15           In addition to the ingredients specifically mentioned above, the formulations of the present invention may include other agents known to those skilled in the art of pharmacy, having regard for the type of formulation in issue. For example, formulations suitable for oral administration may include flavoring agents and formulations suitable for intranasal administration may include perfumes.

### Specific Methods

Compounds of Formulas I, II, I-A and II-A of this invention with alkyl substitution at the 2-propoxy position were prepared by methods analogous to those described in Scheme 1.

10

### Scheme 1

A phenol (2) was coupled to an alcohol (3) to give an aryl ether (4). A secondary amine (7) was prepared by reductive amination of a primary amine (5) with an aldehyde (6). The secondary amine (7) then displaced the alkyl bromine (4) to form a tertiary amine (1-A). The ester of this product was hydrolyzed, if desired, under the reaction conditions in Scheme 1 to afford the acid (1).

15

Compounds of Formulas I, II, I-A and II-A of this invention with alkyl substitution at the 1-propoxy or 3-propoxy positions were prepared by methods analogous to those described in Scheme 2.

5 Scheme 2

A common intermediate for both classes of compounds was the tosylate alcohol (8). The tosylate was displaced by a phenol (2) to give an aryl ether (9). A second tosyl group was introduced at the secondary alcohol and that was then displaced by a secondary amine to form a tertiary amine (1-A). Alternatively, the tosylate (8) could be displaced by the secondary amine to give a tertiary amine (10). Then, the phenol (2) was coupled to the secondary alcohol (10) to give an aryl ether (1-A). The ester product was hydrolyzed, if desired, under the identical reaction conditions given in Scheme 1 to afford the acid (1).

Compounds of Formulas I, II, I-A and II-A of this invention with an alkyl substituent on the aryl benzoic acid were prepared by methods analogous to those described in Scheme 3.

### 5 Scheme 3

The secondary amine (7) displaced the bromine (11) to form a tertiary amine (12). This compound was then coupled to a phenol (13) to give an aryl ether (1-A). The ester of these products may be hydrolyzed, if desired, under the identical reaction conditions given in Scheme 1 to afford the corresponding acid (1).

In cases where a desired amine (5) was not commercially available, it may be prepared by methods analogous to those described Scheme 4.

### Scheme 4

The methyl ester of a commercially available acid (13) may be formed under acidic conditions and reduced to an alcohol (14). The alcohol may be converted to a mesylate group which can be displaced by azide (15). Reduction of the azide can

gave the primary amine (16) that may be used as a substitute for amine compound (5) in any of the other schemes outlined herein.

Compounds of Formulas I, II, I-A and II-A of this invention containing phenyl substitution in the  $W^1$  and/or  $W^2$  groups were prepared by methods analogous to those described in Scheme 5.

Scheme 5

Treatment of ketone (17) under Wittig conditions formed the enol (18) which upon hydrolysis was transformed to the aldehyde (19) (Scheme 5). Reductive amination of (19) with the amine (20) yielded the secondary amine (21). Another reductive amination of (21) with aldehyde 6 formed the ester (22) which upon hydrolysis provided the acid (23).

Compounds of Formulas I, II, I-A and II-A of this invention containing substitution at positions  $R^1$  and/or  $R^2$  were prepared by methods analogous to those described in Scheme 6.

Scheme 6

The alpha alkyl analogs of the carboxylic acids or esters (24) could be synthesized by treatment of (24) with base (either lithium diisopropylamine or sodium hydride) to form the anion and then subsequent addition of different alkyl halides to form either the mono alkylated compound (25) or the dialkylated compound (26) (Scheme 6). Subsequent hydrolysis of the ester (when R = Me) to the acid was achieved by treatment of the esters with lithium chloride in DMF.

Compounds of Formulas I, II, I-A and II-A of this invention containing spiro-ring substitution at positions R<sup>1</sup> and R<sup>2</sup> were prepared by methods analogous to those described in Scheme 7.

5 Scheme 7

Treatment of the sodium anion of (27) with diethyl oxalate formed the tricarbonyl (28) (Scheme 7). Next, reaction of (28) with base and aqueous formaldehyde formed the alkene (29). Cyclopropanation of (29) led to the dibromide (30) which was converted to alcohol (31) through a two step process. Alkylation of (31) with the bromide (32) occurred smoothly to form the ester (33) which underwent a hydrolysis to form the acid (34). The bromide (32) was synthesized via alkylation of (7) with dibromopropane.

Selected compounds of Formulas I, II, I-A and II-A of this invention wherein p is 1, were prepared by methods analogous to those described in Scheme 8.

Scheme 8

The acid (35) was converted to the acyl chloride which underwent an Arndt-Eistert reaction to form the ester (36) (Scheme 8). Hydrolysis of (36) with LiOH provided the acid (37).

Each of the above-described methods further include the optional step(s) of forming a pharmaceutically acceptable salt of a compound of this invention, and/or of forming a pharmaceutically acceptable solvate of a compound of this invention or a pharmaceutically acceptable salt thereof.

The following intermediates are useful in the methods described herein to make the compounds of Formulas I, I-A, II and II-A:

 (R)-[3-(2-Methyl-3-bromopropoxy)phenyl]acetic acid methyl ester;

#### 15      **Test Method 1: Ligand Sensing Assay (LiSA) for LXR $\beta$ Agonist Activity**

This assay measures the recruitment of a peptide derived from the coactivator protein, SRC1, to the agonist-bound LXR $\beta$ . Peptides derived from other nuclear receptor cofactors may be similarly prepared and assayed.

To generate the human LXR $\beta$  ligand binding domain suitable for LiSA, a modified polyhistidine tag (MKKGHHHHHG) (SEQ ID No. 1) was fused in frame to the human LXR $\beta$  ligand binding domain (amino acids 185-461 of Genbank accession number U07132) and subcloned into the expression vector pRSETa (Invitrogen) under the control of an IPTG inducible T7 promoter. The human LXR $\beta$  ligand binding domain was expressed in E. coli strain BL21(DE3). Ten-liter fermentation batches were grown in Rich PO<sub>4</sub> media with 0.1 mg/mL Ampicillin at 25°C for 12 hours, cooled to 9°C and held at that temperature for 36 hours to a density of OD<sub>600</sub>=14. At this cell density, 0.25 mM IPTG was added and induction proceeded for 24 hours at 9°C, to a final OD<sub>600</sub> = 16. Cells were harvested by centrifugation (20 minutes, 3500g, 4°C), and concentrated cell slurries were stored in PBS at -80°C.

Typically 25-50 g of cell paste is resuspended in 250-500 mL TBS, pH 8.0 (25mM Tris, 150 mM NaCl). Cells are lysed by passing 3 times through an APV Rannie MINI-lab homogenizer and cell debris is removed by centrifugation (30 minutes, 20,000g, 4°C). The cleared supernatant is filtered through coarse pre-filters, and TBS, pH 8.0, containing 500 mM imidazole is added to obtain a final

imidazole concentration of 50mM. This lysate is loaded onto a column (XK-26, 10 cm) packed with Sepharose [Ni<sup>++</sup> charged] Chelation resin (available from Pharmacia) and pre-equilibrated with TBS pH 8.0/ 50mM imidazole. After washing to baseline absorbance with equilibration buffer, the column is washed with  
5 approximately one column volume of TBS pH -8.0 containing 95mM imidazole. LXRβLBD(185-461) is eluted with a gradient from 50 to 500 mM imidazole. Column peak fractions are pooled immediately and diluted 5 fold with 25 mM Tris pH 8.0, containing 5% 1,2-propanediol, 0.5mM EDTA and 5mM DTT. The diluted protein sample is then loaded onto a column (XK-16, 10cm) packed with Poros HQ resin  
10 (anion exchange). After washing to baseline absorbance with the dilution buffer the protein is eluted with a gradient from 50 -500 mM NaCl. Peak fractions are pooled and concentrated using Centri-prep 10K (Amicon) filter devices and subjected to size exclusion, using a column (XK-26, 90 cm) packed with Superdex-75 resin (Pharmacia) pre-equilibrated with TBS, pH 8.0, containing 5 % 1,2-propanediol,  
15 0.5mM EDTA and 5mM DTT.

LXRβ protein was diluted to approximately 10μM in PBS and five-fold molar excess of NHS-LC-Biotin (Pierce) was added in a minimal volume of PBS. This solution was incubated with gentle mixing for 30 minutes at ambient room temperature. The biotinylation modification reaction was stopped by the addition of  
20 2000x molar excess of Tris-HCl, pH 8. The modified LXRβ protein was dialyzed against 4 buffer changes, each of at least 50 volumes, PBS containing 5mM DTT, 2mM EDTA and 2% sucrose. The biotinylated LXRβ protein was subjected to mass spectrometric analysis to reveal the extent of modification by the biotinylation reagent. In general, approximately 95% of the protein had at least a single site of  
25 biotinylation; and the overall extent of biotinylation followed a normal distribution of multiple sites, ranging from one to nine.

The biotinylated protein was incubated for 20-25 minutes at a concentration of 5nM in assay buffer (50mM NaF, 50mM MOPS-pH 7.5, 0.1mg/ml FAF-BSA, 0.05mM CHAPS, 10mM DTT) with equimolar amounts of streptavidin-  
30 AlloPhycoCyanin (APC, Molecular Probes). At the same time, the biotinylated peptide comprising amino acids 676-700 of SRC-1 (CPSSHSSLTERHKILHRLLQEGSPS-CONH<sub>2</sub>) (SEQ ID No. 2) at a concentration of 10nM was incubated in assay buffer with a ½ molar amount of streptavidin-labelled Europium (Wallac) for 20-25 minutes. After the initial incubations are  
35 completed, a 20 molar excess of biotin was added to each of the solutions to block the unattached streptavidin reagents. After 20 min at room temp, the solutions were

mixed yielding a concentration of 5nM for the dye-labeled LXR protein and 10nM for SRC-1 peptide.

49μL of the protein/peptide mixture was added to each well of an assay plate containing 1ul of test compound serial diluted in 100% DMSO. The final volume in each well was 0.05mL, and the concentration in the well for the dye-labeled protein and peptide was 5nM protein and 10nM SRC1-peptide. The final test compound concentrations were between 33pM and 20μL. The plates were incubated at room temp 2-hours and then counted on a Wallac Victor V fluorescent plate reader.

10 In this assay 1  $\mu$ M 24(S), 25-epoxycholesterol gave a reading of 20000  
fluorescence units over a background reading of 10000 fluorescence units.

### Test Method 2: Ligand Sensing Assay for LXR $\alpha$ Agonist Activity

The assay for LXR $\alpha$  was run according to the procedures of **Test Method 1**,  
15 above using his-tagged LXR $\alpha$  ligand binding domain (amino acids 183-447 of  
Genbank accession number U22662 , with the 14<sup>th</sup> amino acid corrected to A from  
R). In this assay 1 $\mu$ M 24(S),25-epoxycholesterol gave a reading of 20000  
fluorescence units over a background reading of 10000 fluorescence units.

a) 1-Methoxy-2,2-bis(4-fluoro-phenyl)-propene

To a stirring solution of THF (300 mL) at room temperature was added methoxymethyltriphenylphosphonium chloride (16.5 g, 48.1 mmol) and sodium tert-butoxide (4.6 g, 48.1 mmol). The orange-red solution was stirred for 1h, and then bis(4-fluoro)-benzophenone (7.0 g, 32.1 mmol) was added and the mixture was heated at 60 °C for 3h. The reaction mixture was cooled to room temperature and filtered through a fritted funnel. The filtrate was concentrated down and dissolved in diethyl ether. The resulting precipitate was filtered off, and the ethereal filtrate was concentrated (this process was repeated until triphenylphosphine oxide stopped precipitating out of ether solution). The crude product was then subjected to flash silica gel chromatography (1% Et<sub>2</sub>O:hexane to 5% Et<sub>2</sub>O:hexane) to afford the title compound as a white solid, 4.38 g (55%). MS (ESI) 247.0 ( $M+H^+$ ).

b) Bis- (4-fluoro-phenyl)-acetaldehyde

To a stirring solution of 1-methoxy-2,2-bis(4-fluoro-phenyl)-propene (0.22 g, 0.81 mmol) in 2 mL of glacial acetic acid was added perchloric acid (70 %, 0.2 mL). After stirring for 1h at RT, the reaction mixture was diluted with water and

extracted with EtOAc. The organic layer was washed with saturated  $\text{NaHCO}_3$ , water, brine, dried over  $\text{Na}_2\text{SO}_4$  and concentrated in vacuo to give an oil, 0.18 g (96 %). The aldehyde was used in the next step without further purification.

Next DIAD (2.36 mL, 12 mmol) was added dropwise over 10 min. After stirring overnight at RT the reaction mixture was concentrated and the residue was purified by normal phase HPLC (10 to 60 % EtOAc:hexane). The title compound was obtained as an oil (2.55 g, 79 %). MS (ESI): 324.2 ( $\text{M}+\text{H}^+$ )

To a stirring mixture of [3-(3-*t*-Butoxycarbonylamino-propoxy)-phenyl]-acetic acid methyl ester (1.35 g, 4.18 mmol) in MeOH (5 mL) was added HCl (5 mL, 4 M solution in dioxane). The mixture was stirred overnight at RT and concentrated. Toluene was added and the solution was evaporated to facilitate  $\text{H}_2\text{O}$  removal via azeotrope evaporation (under reduced pressure). Ether was added and evaporated under (under reduced pressure) to afford the title compound as a white solid (0.75 g, 69 %). MS (ESI): 224.2 ( $\text{M}+\text{H}^+$ )

After stirring for 2h at RT, the reaction mixture was concentrated.

30 The resulting residue was partitioned between EtOAc and saturated  $\text{NaHCO}_3$  and extracted. The organic layer was washed with water, brine, dried over  $\text{MgSO}_4$ , and filtered. After concentration of the filtrate in vacuo, the crude product was purified by column chromatography over silica gel (silica gel 60, EM Science) using 1 %MeOH-0.5 % conc.  $\text{NH}_4\text{OH}$ -dichloromethane to give 0.185 g of an oil (42%).
